SECTION 01

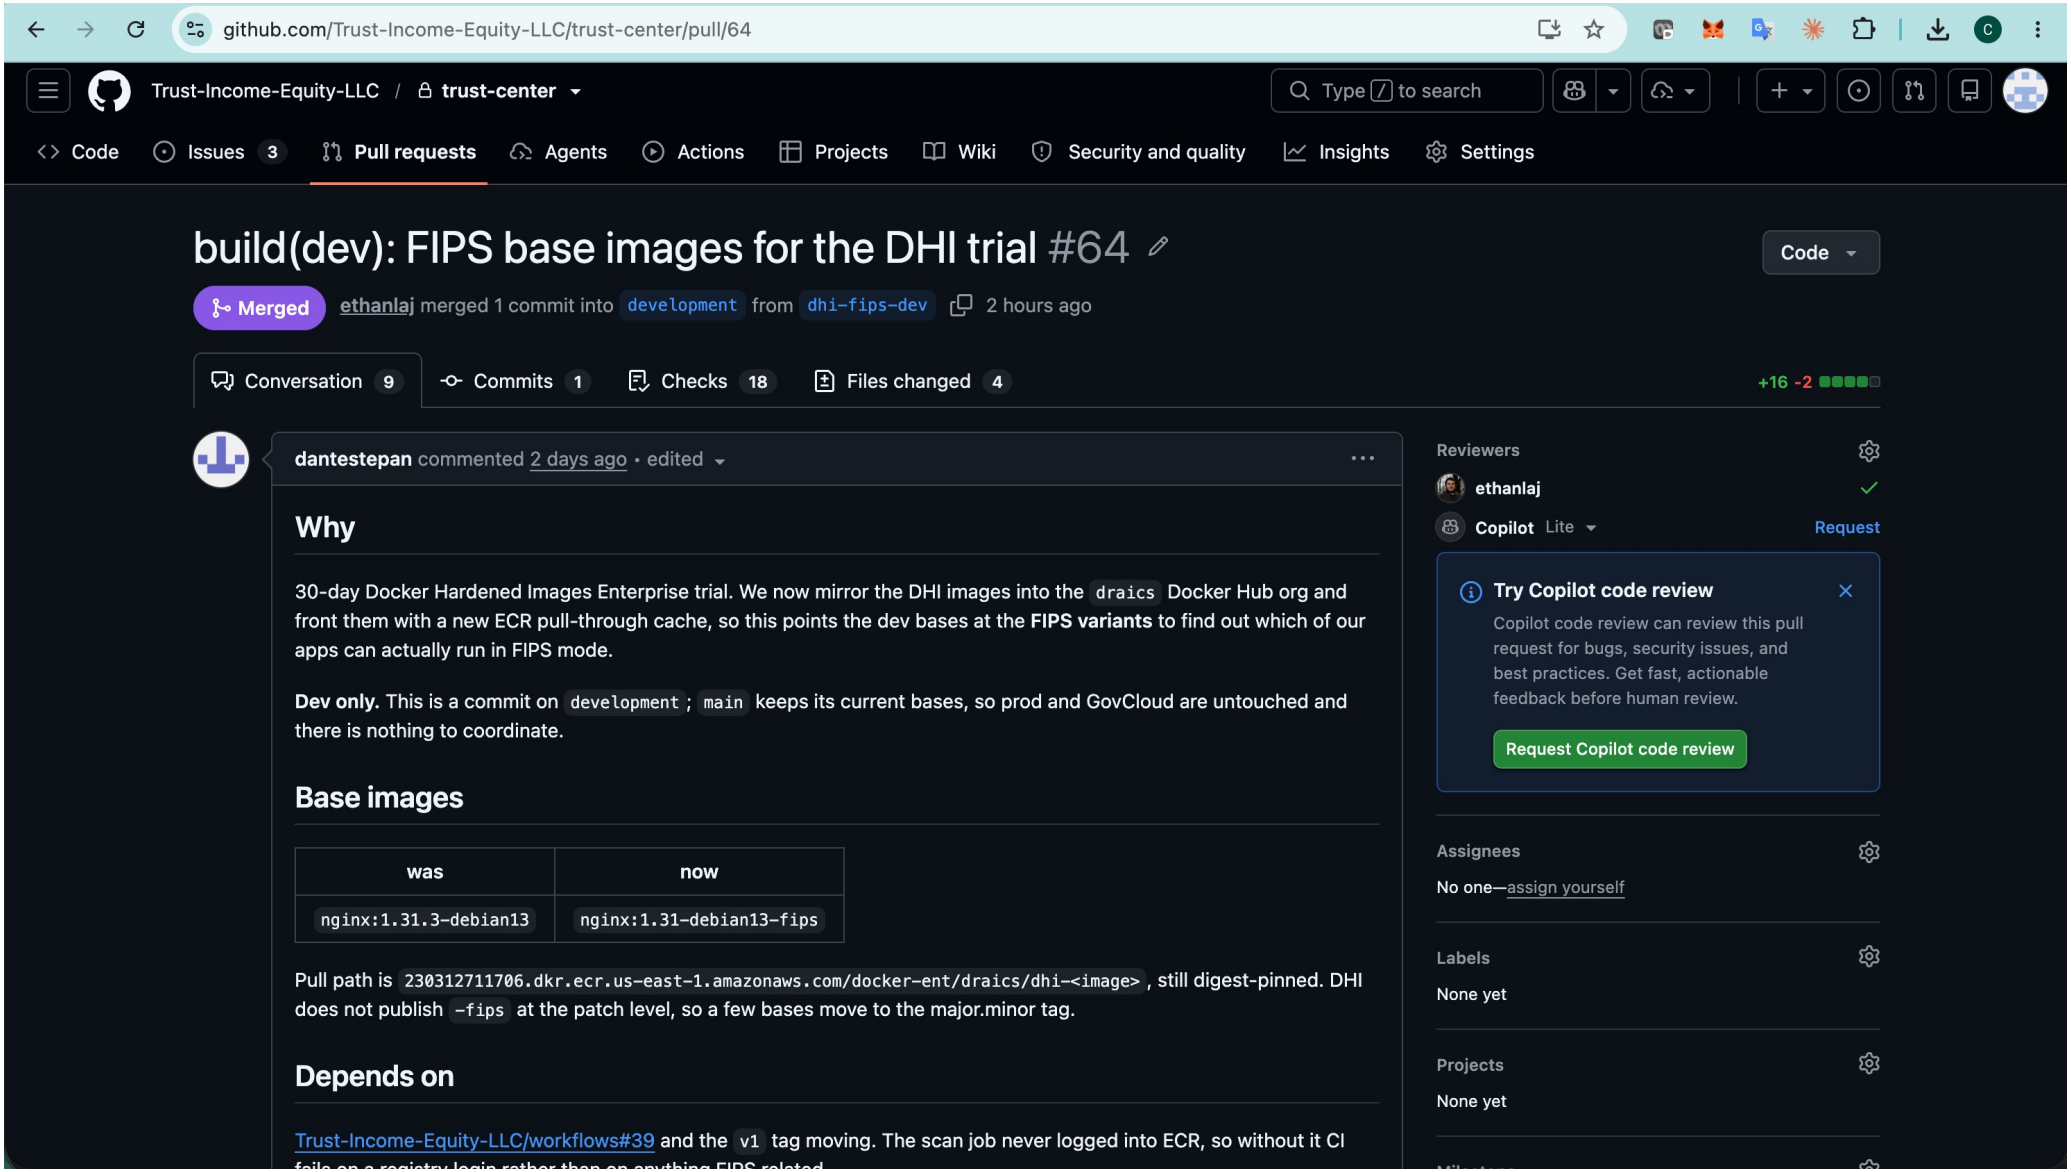

NOTES

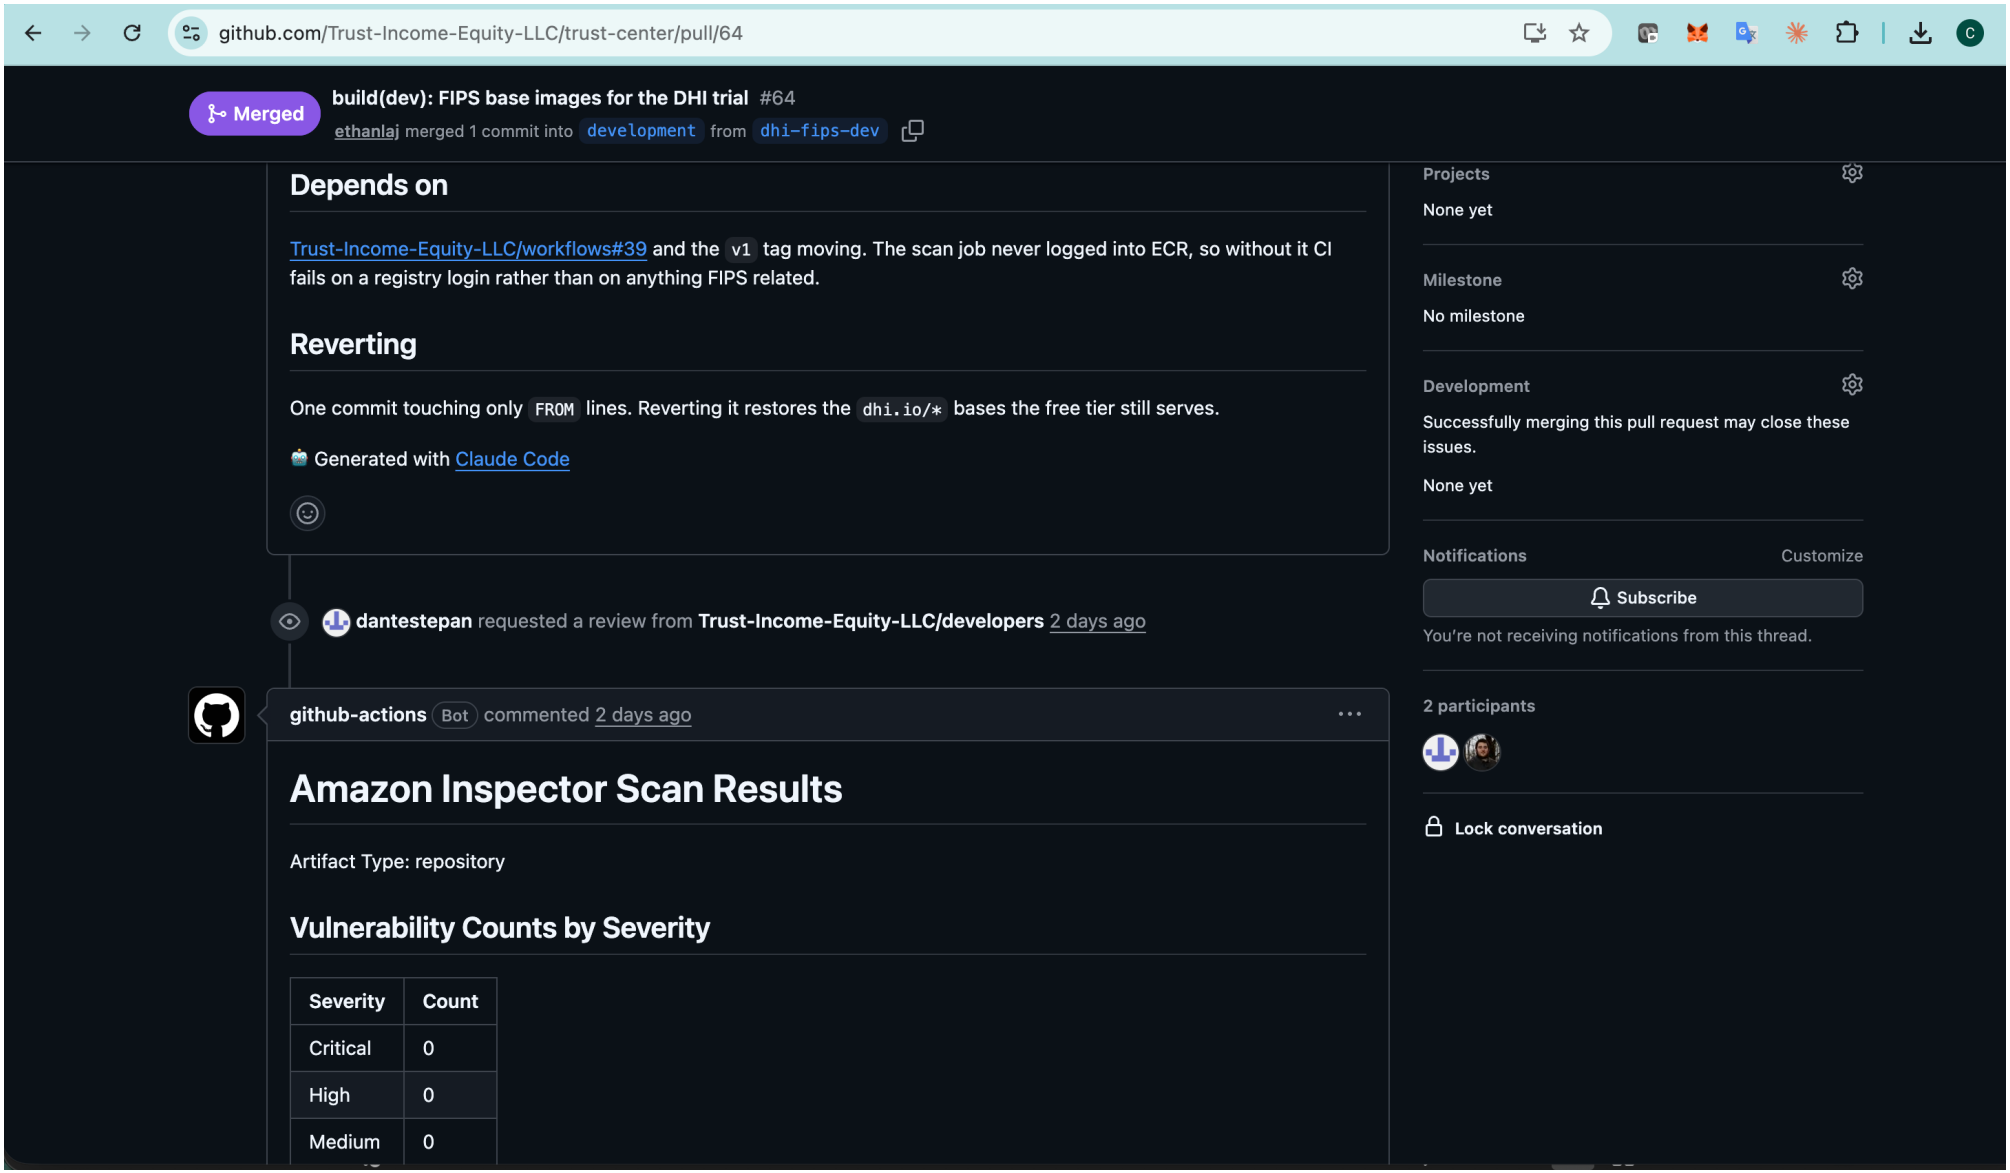

YESTERDAY: HANDOFFS, MEETINGS, WAITING, REWORK

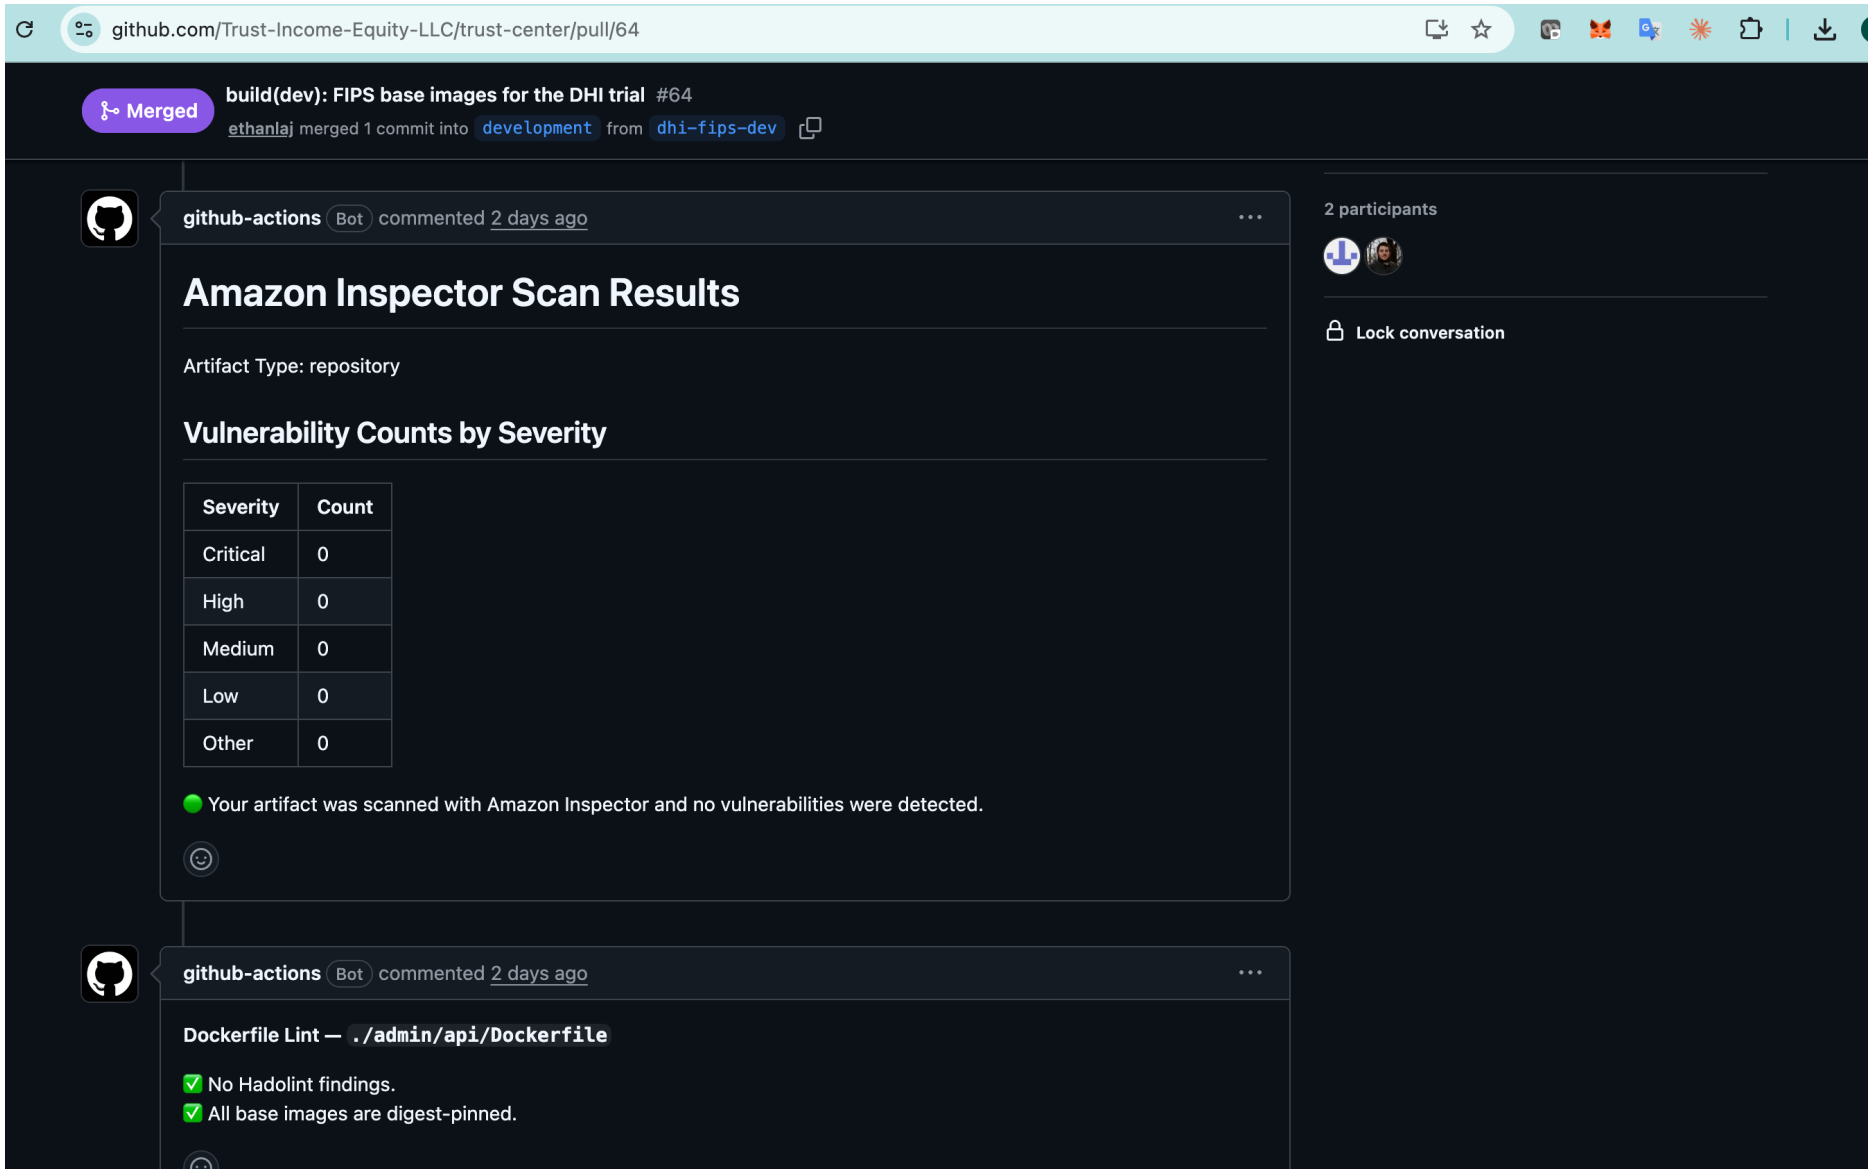

Nine stations, eight handoffs — and context leaks at every joint.

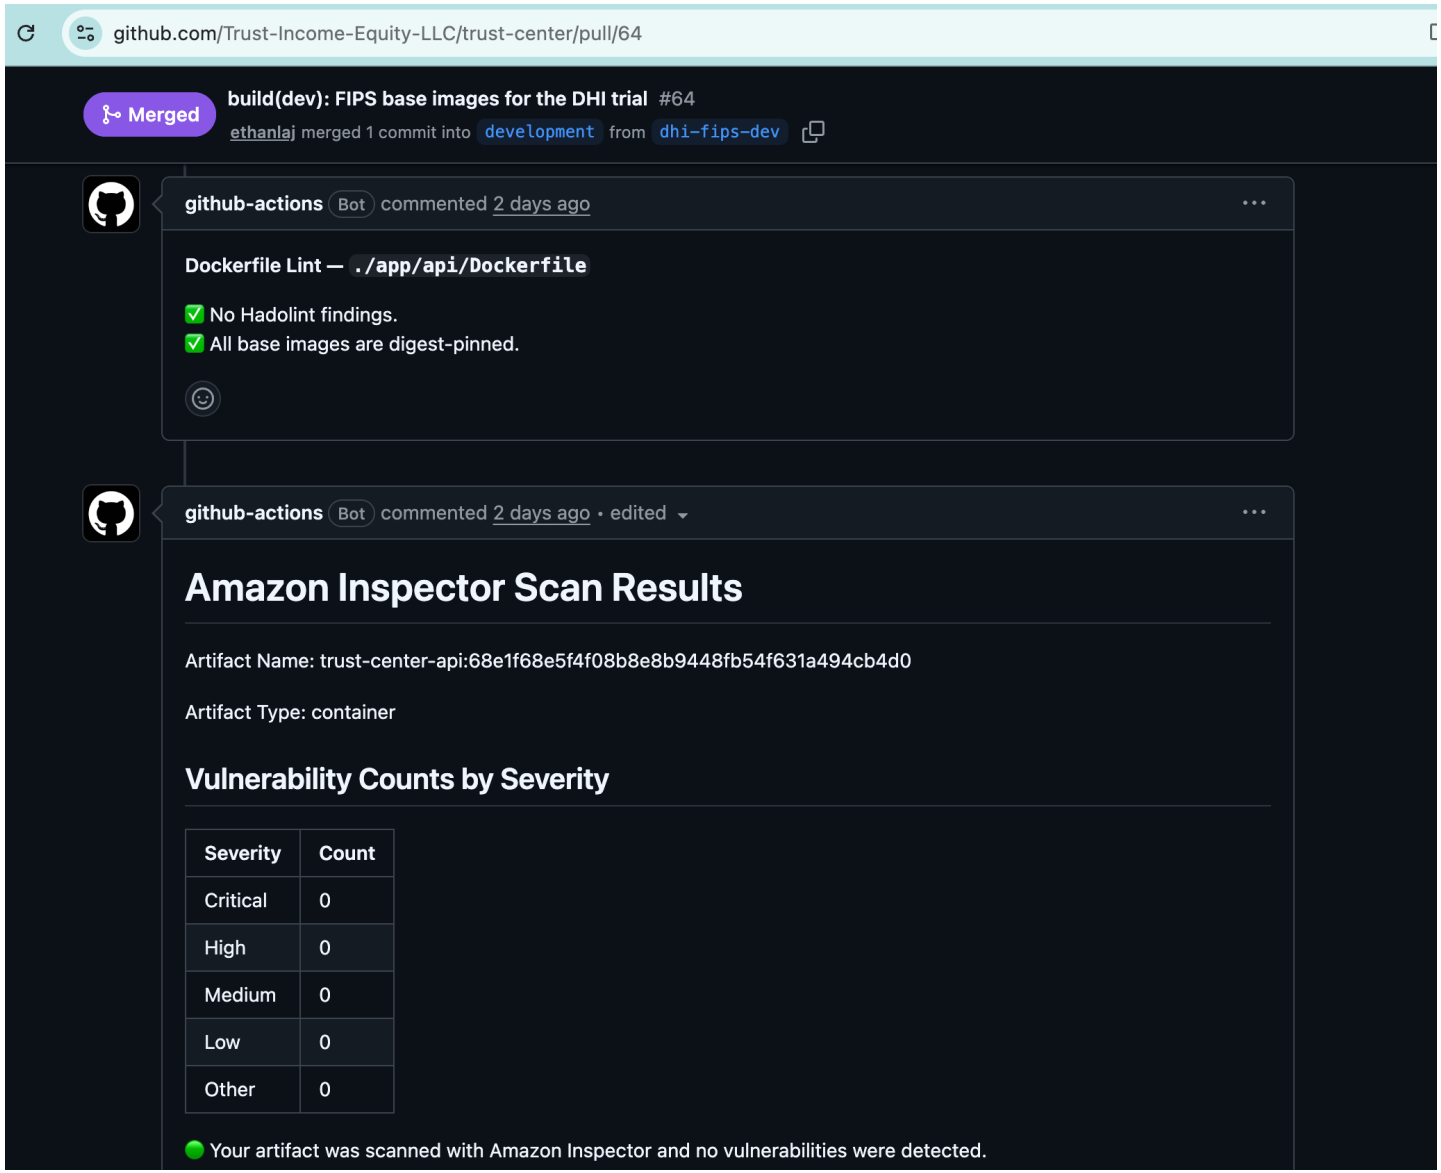

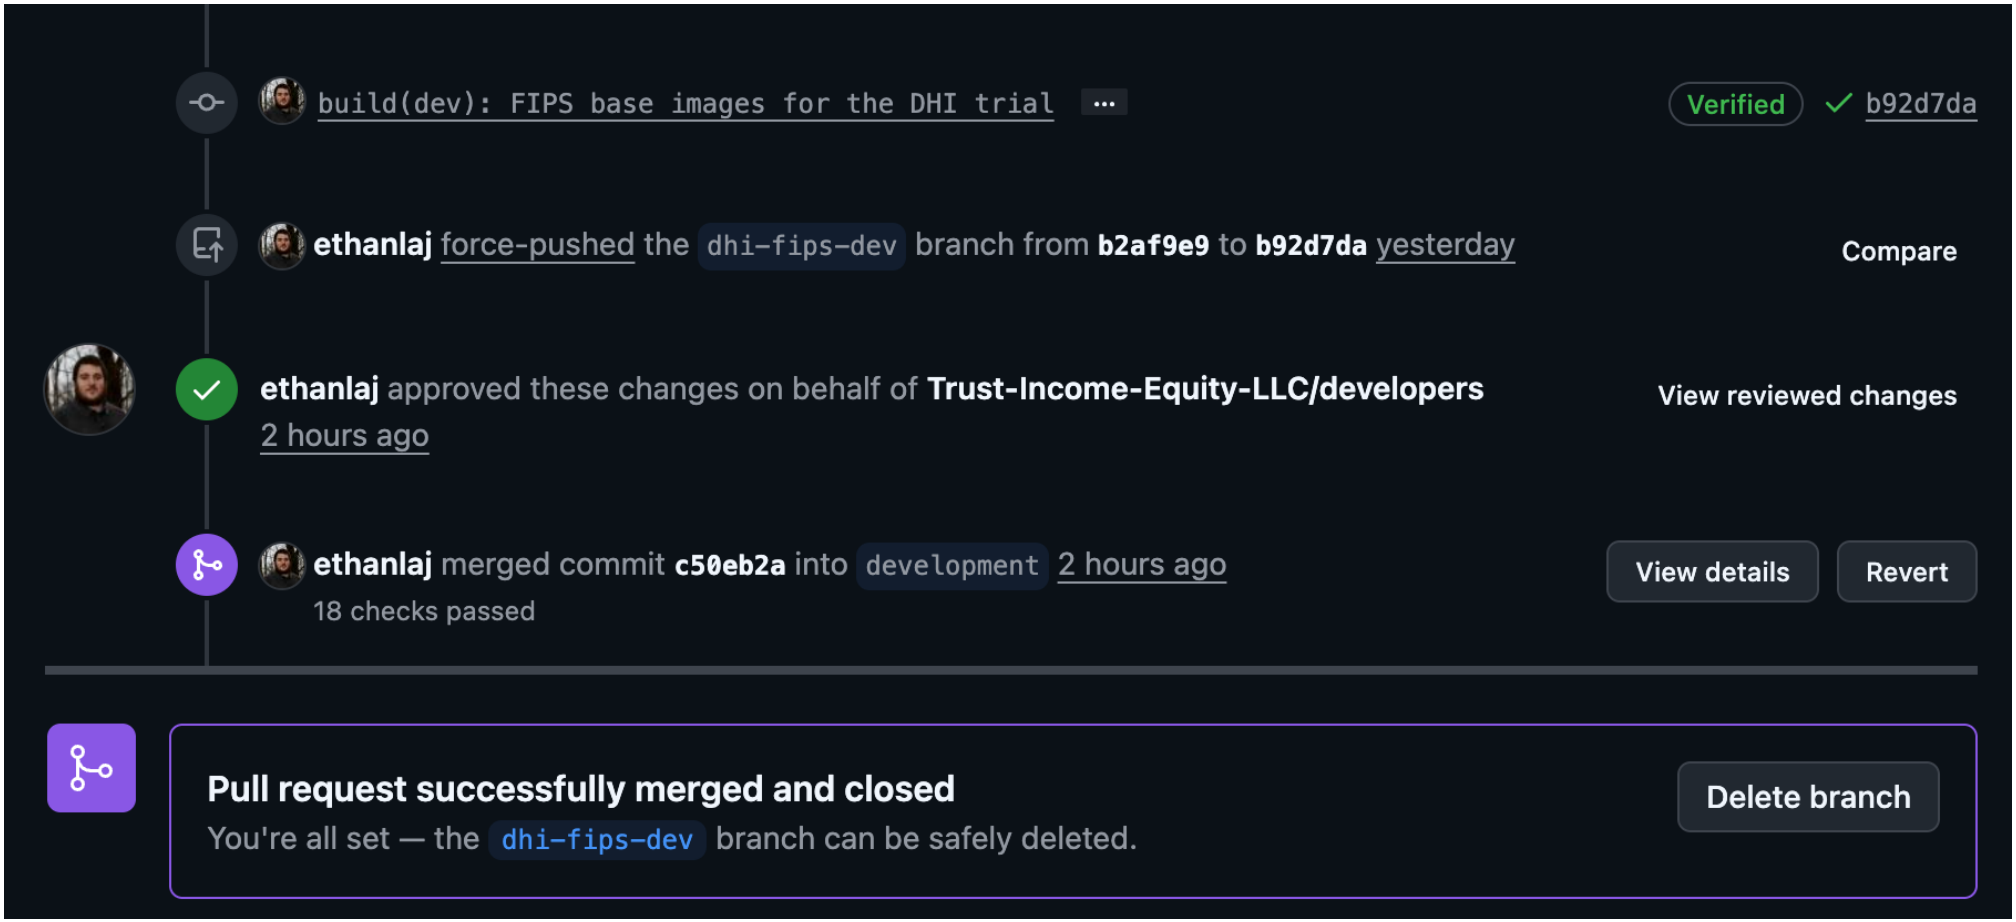

Each step often loses context. Every handoff creates translation error, delay, and rework — that is where the six weeks live.

Why
30-day Docker Hardened Images Enterprise trial. We now mirror the DHI images into the draics Docker Hub org and front them with a new ECR pull-through cache, so this points the dev bases at the FIPS variants to find out which of our apps can actually run in FIPS mode.
Dev only. This is a commit on development; main keeps its current bases, so prod and GovCloud are untouched and there is nothing to coordinate.
Base images
was
now
nginx:1.31.3-debian13
nginx:1.31-debian13-fips
Pull path is 230312711706.dkr.ecr.us-east-1.amazonaws.com/docker-ent/draics/dhi-<image>, still digest-pinned. DHI does not publish -fips at the patch level, so a few bases move to the major.minor tag.
Depends on
Trust-Income-Equity-LLC/workflows#39 and the v1 tag moving. The scan job never logged into ECR, so without it CI

01 RESEARCH SYNTHESIS

Research no longer starts the cycle. It feeds every cycle.

INPUTS — ALWAYS FLOWING

- Discrepancy reports and trouble tickets
- Feature requests and support themes
- User behavior signals
- DX/CX trends and operational pain points
- Codebase reality — what the system can absorb

OUTPUT BY END OF DAY

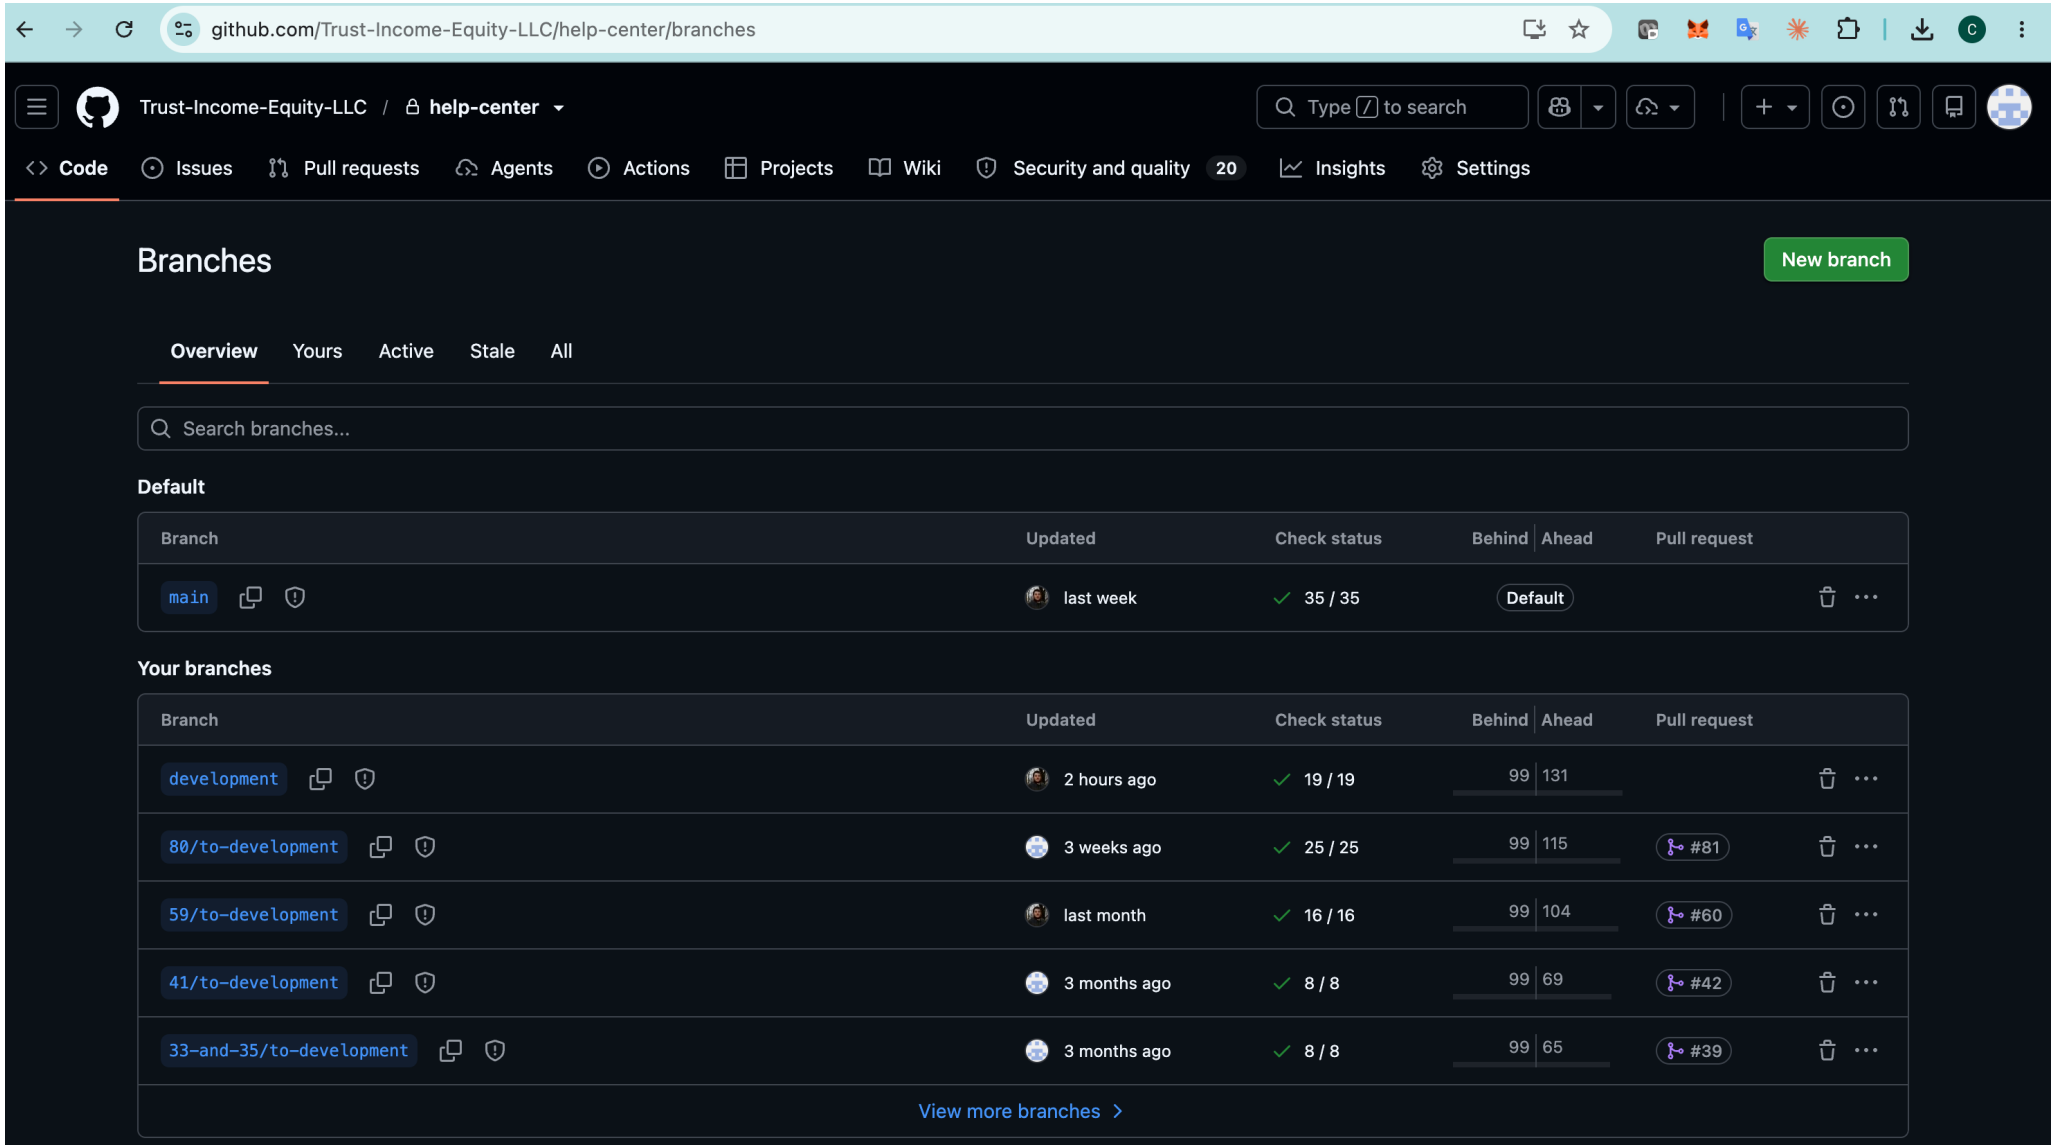

- A ranked, evidence-backed change thesis
- What users need · cited to source tickets
- What is breaking · with frequency data
- What creates the highest mission value

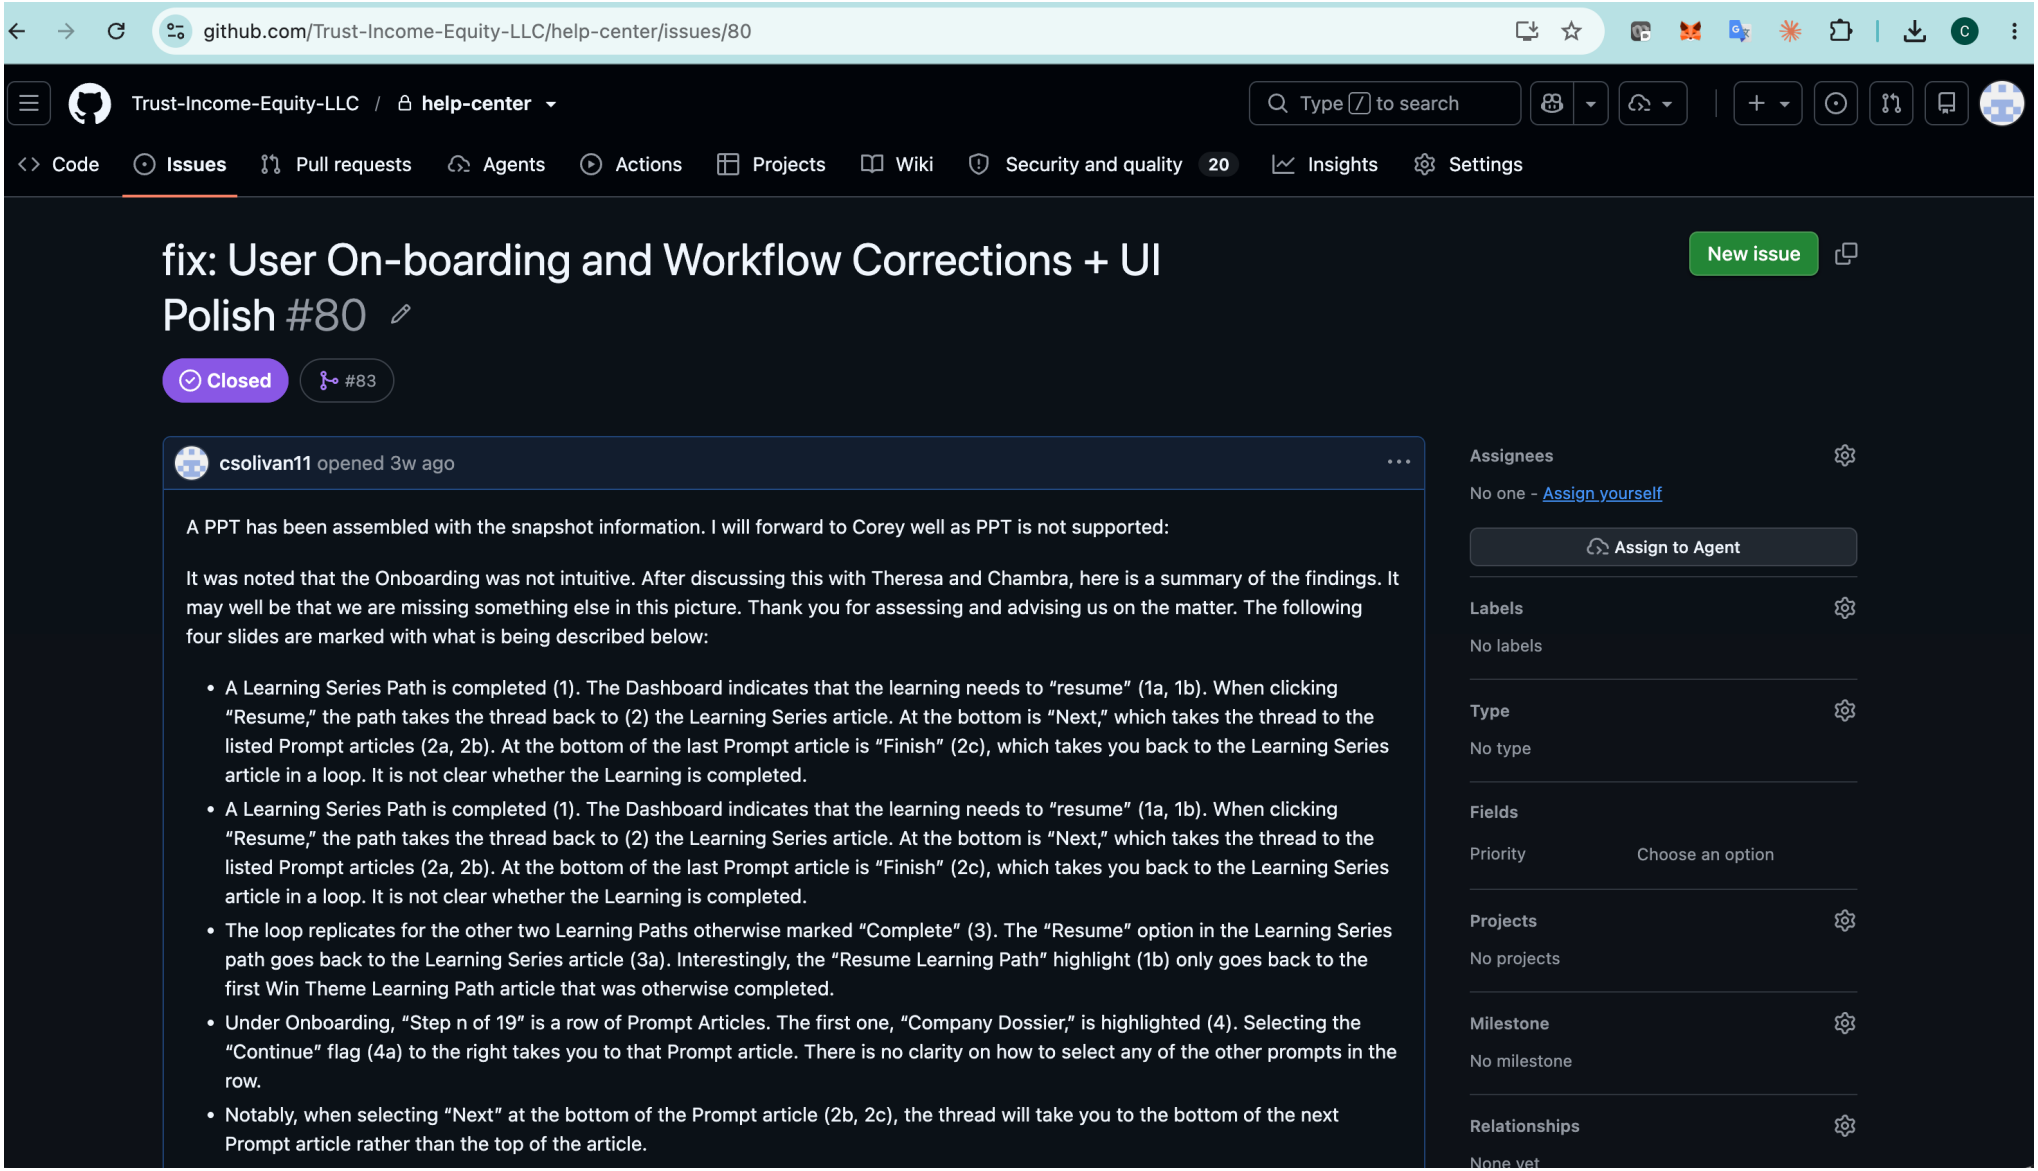

HUMAN GATE · DAY 1

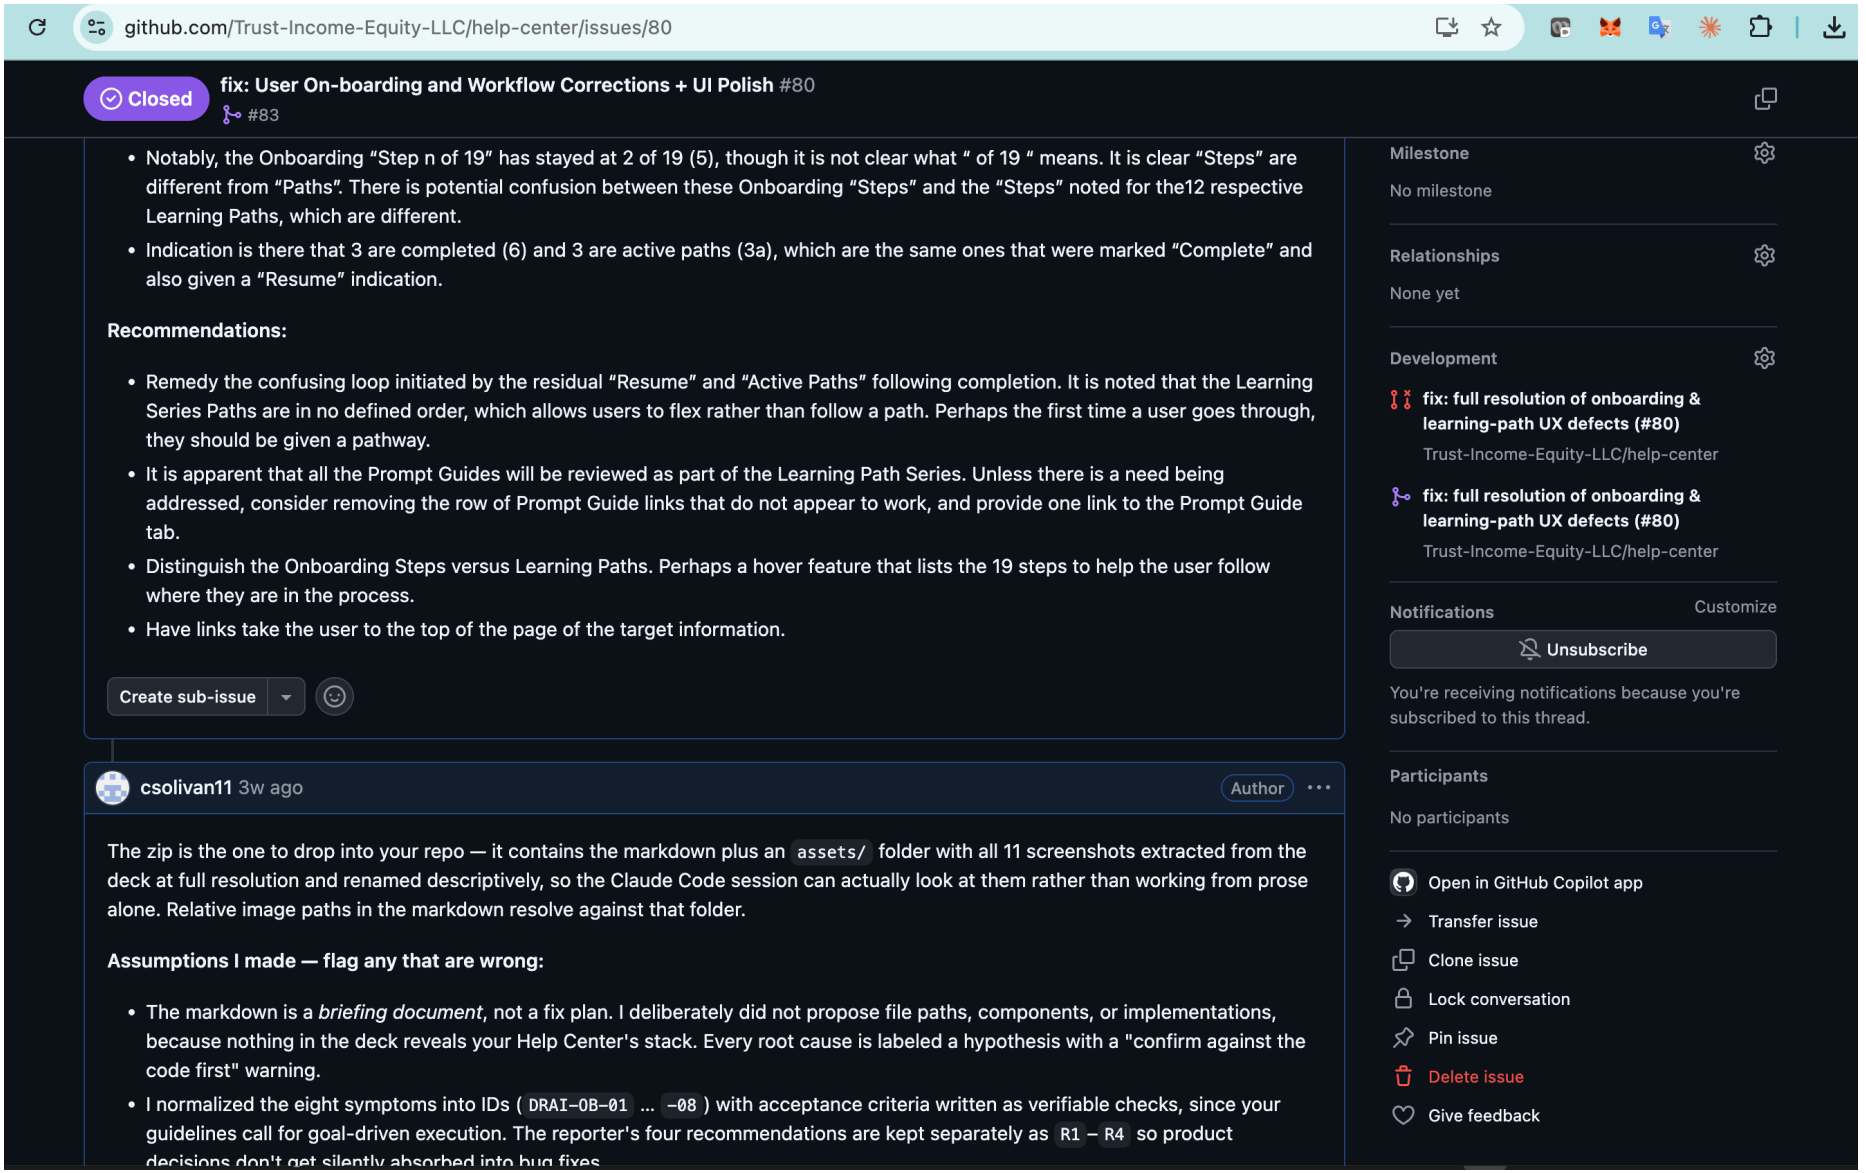

Product owner approves the ranked thesis — agents rank, humans decide what matters.

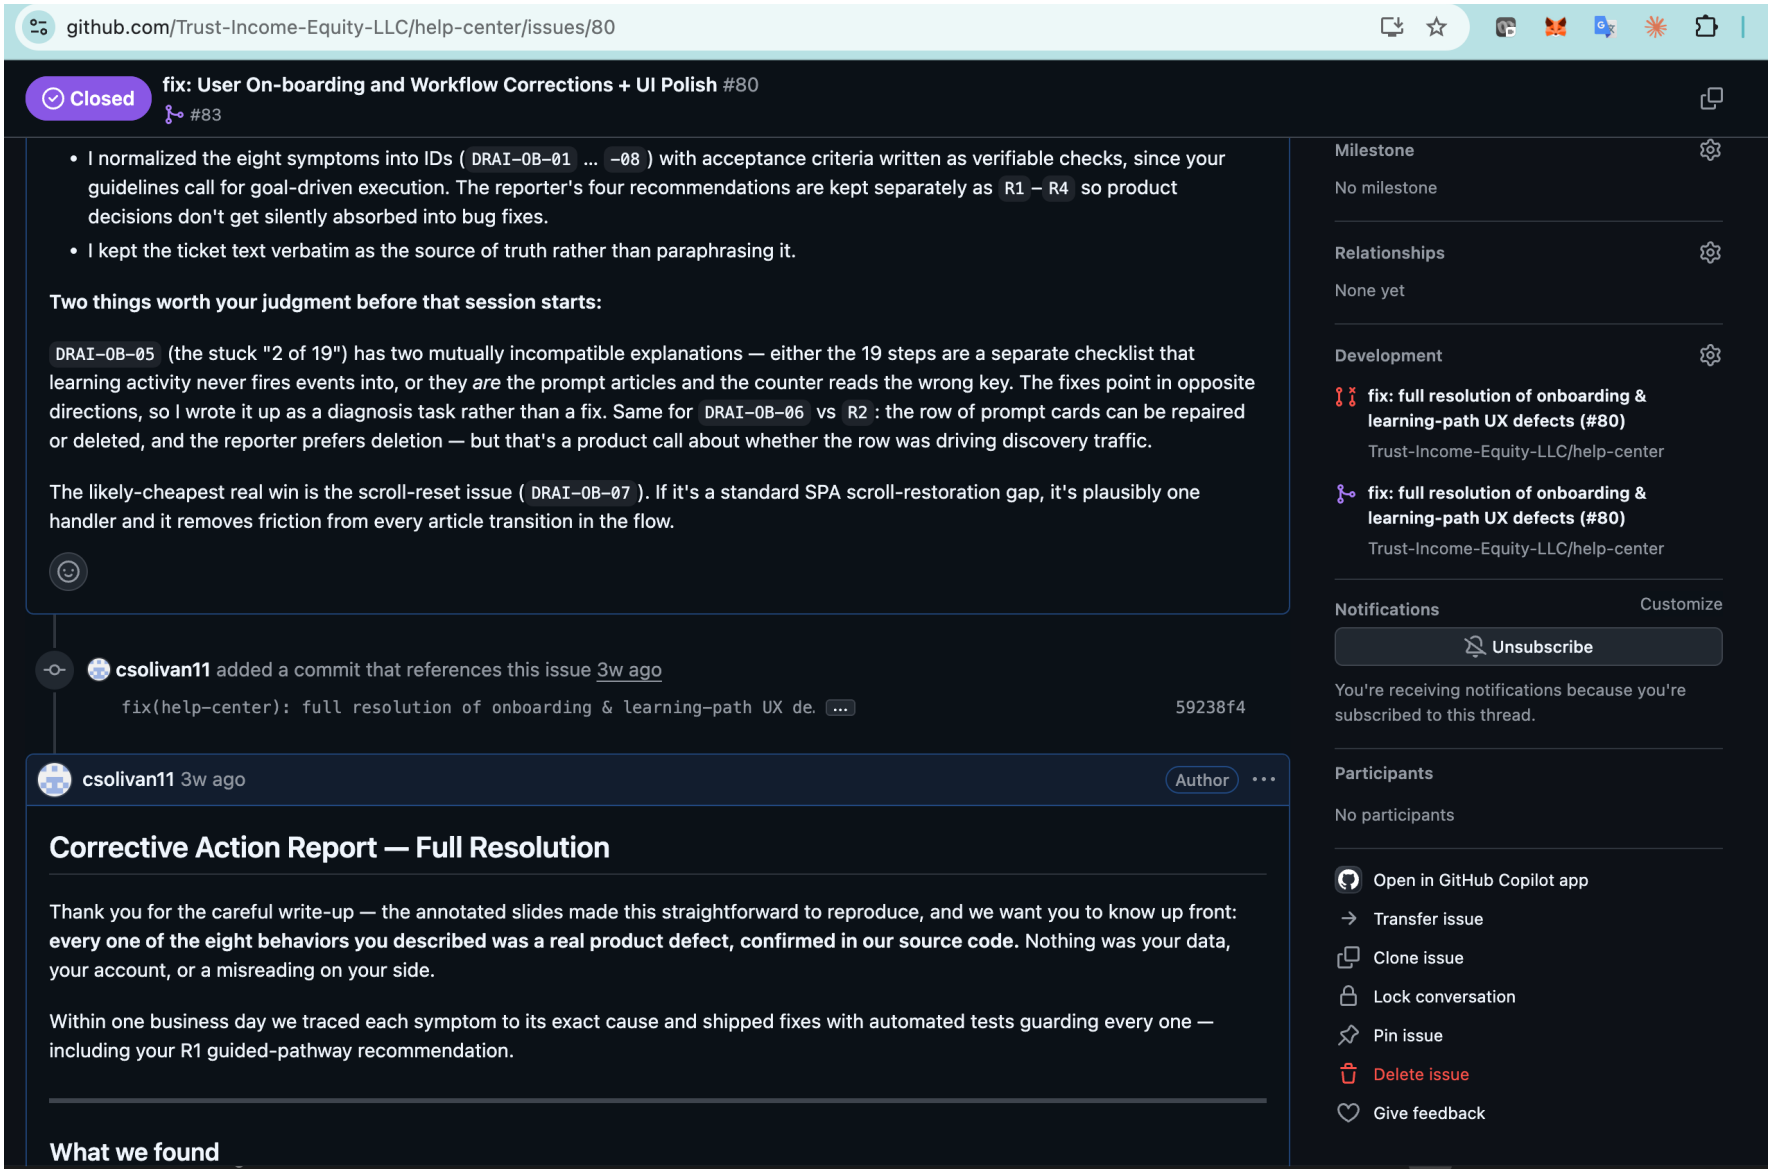

FROM OUR FACTORY

1,786 issues worked in 259 days — agents posted 8,295 triage and synthesis comments along the way.

fix: User On-boarding and Workflow Corrections + UI Polish #80
New issue
Closed
#83
csolivan11 opened 3w ago
A PPT has been assembled with the snapshot information. I will forward to Corey well as PPT is not supported:
It was noted that the Onboarding was not intuitive. After discussing this with Theresa and Chambra, here is a summary of the findings. It may well be that we are missing something else in this picture. Thank you for assessing and advising us on the matter. The following four slides are marked with what is being described below:
A Learning Series Path is completed (1). The Dashboard indicates that the learning needs to "resume" (1a, 1b). When clicking "Resume," the path takes the thread back to (2) the Learning Series article. At the bottom is "Next," which takes the thread to the listed Prompt articles (2a, 2b). At the bottom of the last Prompt article is "Finish" (2c), which takes you back to the Learning Series article in a loop. It is not clear whether the Learning is completed.
A Learning Series Path is completed (1). The Dashboard indicates that the learning needs to "resume" (1a, 1b). When clicking "Resume," the path takes the thread back to (2) the Learning Series article. At the bottom is "Next," which takes the thread to the listed Prompt articles (2a, 2b). At the bottom of the last Prompt article is "Finish" (2c), which takes you back to the Learning Series article in a loop. It is not clear whether the Learning is completed.
The loop replicates for the other two Learning Paths otherwise marked "Complete" (3). The "Resume" option in the Learning Series path goes back to the Learning Series article (3a). Interestingly, the "Resume Learning Path" highlight (1b) only goes back to the first Win Theme Learning Path article that was otherwise completed.
Under Onboarding, "Step n of 19" is a row of Prompt Articles. The first one, "Company Dossier," is highlighted (4). Selecting the "Continue" flag (4a) to the right takes you to that Prompt article. There is no clarity on how to select any of the other prompts in the row.
Notably, when selecting "Next" at the bottom of the Prompt article (2b, 2c), the thread will take you to the bottom of the next Prompt article rather than the top of the article.

fix: User On-boarding and Workflow Corrections + UI Polish #80
#83
• Notably, the Onboarding “Step n of 19” has stayed at 2 of 19 (5), though it is not clear what “ of 19 “ means. It is clear “Steps” are different from “Paths”. There is potential confusion between these Onboarding “Steps” and the “Steps” noted for the12 respective Learning Paths, which are different.
• Indication is there that 3 are completed (6) and 3 are active paths (3a), which are the same ones that were marked “Complete” and also given a “Resume” indication.
Recommendations:
• Remedy the confusing loop initiated by the residual “Resume” and “Active Paths” following completion. It is noted that the Learning Series Paths are in no defined order, which allows users to flex rather than follow a path. Perhaps the first time a user goes through, they should be given a pathway.
• It is apparent that all the Prompt Guides will be reviewed as part of the Learning Path Series. Unless there is a need being addressed, consider removing the row of Prompt Guide links that do not appear to work, and provide one link to the Prompt Guide tab.
• Distinguish the Onboarding Steps versus Learning Paths. Perhaps a hover feature that lists the 19 steps to help the user follow where they are in the process.
• Have links take the user to the top of the page of the target information.

Author
The zip is the one to drop into your repo — it contains the markdown plus an assets/ folder with all 11 screenshots extracted from the deck at full resolution and renamed descriptively, so the Claude Code session can actually look at them rather than working from prose alone. Relative image paths in the markdown resolve against that folder.
Assumptions I made — flag any that are wrong:
• The markdown is a briefing document, not a fix plan. I deliberately did not propose file paths, components, or implementations, because nothing in the deck reveals your Help Center's stack. Every root cause is labeled a hypothesis with a "confirm against the code first" warning.
• I normalized the eight symptoms into IDs (DRAI-OB-01 … -08) with acceptance criteria written as verifiable checks, since your guidelines call for goal-driven execution. The reporter's four recommendations are kept separately as R1 – R4 so product decisions don't get silently absorbed into bug fixes

#83
I normalized the eight symptoms into IDs (DRAI-OB-01 … -08) with acceptance criteria written as verifiable checks, since your guidelines call for goal-driven execution. The reporter's four recommendations are kept separately as R1 – R4 so product decisions don't get silently absorbed into bug fixes.
I kept the ticket text verbatim as the source of truth rather than paraphrasing it.
Two things worth your judgment before that session starts:
DRAI-OB-05 (the stuck "2 of 19") has two mutually incompatible explanations — either the 19 steps are a separate checklist that learning activity never fires events into, or they are the prompt articles and the counter reads the wrong key. The fixes point in opposite directions, so I wrote it up as a diagnosis task rather than a fix. Same for DRAI-OB-06 vs R2 : the row of prompt cards can be repaired or deleted, and the reporter prefers deletion — but that's a product call about whether the row was driving discovery traffic.
The likely-cheapest real win is the scroll-reset issue (DRAI-OB-07). If it's a standard SPA scroll-restoration gap, it's plausibly one handler and it removes friction from every article transition in the flow.

Corrective Action Report — Full Resolution
Thank you for the careful write-up — the annotated slides made this straightforward to reproduce, and we want you to know up front: every one of the eight behaviors you described was a real product defect, confirmed in our source code. Nothing was your data, your account, or a misreading on your side.
Within one business day we traced each symptom to its exact cause and shipped fixes with automated tests guarding every one — including your R1 guided-pathway recommendation.

Closed **fix: User On-boarding and Workflow Corrections + UI Polish** #80
#83

What we found

All eight behaviors trace back to **three root causes**:

1. **One faulty rule** treated any path with *any* progress as "active" — including paths at 100%. That single rule produced the Resume button on completed paths, the dashboard Resume that always reopened the first Win Theme article, and the same three paths counted as both "Complete" and "Active."
2. **One mis-wired button** — "Finish" was wired to the same code as "Back to series." It saved nothing and skipped a congratulations screen that, we discovered, was already fully built but unreachable.
3. **One signal mismatch** — the "Step n of 19" counter only counted an article when you clicked 👍/👎 feedback. *Reading* it was logged somewhere the counter never looked, so it froze at 2 of 19.

The journey, before → after

	Before (as reported)	After (shipped)
Completed path	Still says **Resume**; reopens step 1	Says **Completed**; offers **Review**; Resume only on unfinished paths, jumping to your first unfinished step
"Next" between articles	Lands at the **bottom** of the page	Every navigation lands at the **top**
"Finish" on last article	Loops back to the series overview, saves nothing	Records your completion, shows a congratulations screen, and offers **Start next path**
Onboarding counter	Frozen at "Step 2 of 19"	"n of 19 **milestones** complete" — advances the moment you finish reading an article
Prompt card row	Not clickable (not even the highlighted card); shows 4 of 19	Expandable checklist of **all 19 milestones**, each clickable, your position marked
Stats	3 "Completed" *and* 3 "Active" — same paths	Not-started / active / completed are mutually exclusive; the numbers agree with the lists

#83

Defect ledger

ID	Sev	What you saw (your callouts)	Resolution
OB-01	S1	Completed paths still show "Resume" (1, 1a, 3)	Active and completed are now disjoint; completed paths show **Completed + Review**
OB-02	S1	"Finish" loops back to the series article (2c)	Finish persists completion and shows the congratulations screen
OB-03	S1	Dashboard "Resume" always opens step 1 (1b)	Resume computes the first incomplete step; stale deep links cleared
OB-04	S1	Same 3 paths counted Completed *and* Active (3a, 6)	Counts are disjoint: not-started + active + completed = total
OB-05	S1	Counter stuck at "Step 2 of 19" (5)	Your hypothesis #2 was right — completions were recorded under a different key. Reading now counts (durable read tracking added)
OB-06	S2	Prompt-card row not clickable (4, 4a)	Replaced with an expandable, fully clickable 19-milestone checklist
OB-07	S2	"Next" lands at the bottom of the page (2b, 2c)	Scroll resets on every step change, tab change, and deep link
OB-08	S2	"Steps" means two different things	Onboarding = **Milestones**; **Steps** belongs exclusively to learning paths

Your recommendations

- **R1 — built.** First-time users see *"New here? Follow the guided pathway"* on the Learning tab, with the first path tagged **Recommended next**. With progress, it becomes *"Continue pathway — next stop: …"*, and every congratulations screen offers **Start next path**. It guides without gating — users who prefer to flex can still open any path at any time.
- **R2 + R3 — merged.** Rather than deleting the dead row, it became the working all-milestones checklist with your position marked. (If you'd still prefer a single link to the Prompt Guides tab, say the word — it's a small change.)
- **R4 — done.** Links land at the top, everywhere.

fix: User On-boarding and Workflow Corrections + UI Polish #80
#83
Verification
69 client UI tests passing (new suites: Finish/scroll/review-mode/deep-links, dashboard disjoint counts, milestone checklist, guided pathway)
243 Admin API tests passing (incl. read-marks-article-complete, exactly once)
56 App API tests passing; TypeScript, lint, and production build clean
One transparency note: past article reads predate the new read tracking, so your milestone counter advances as you touch articles from now on (any prior 👍/👎 feedback already counts). The stuck "2 of 19" will move the first time the next article is opened.
Thank you again — reports at this level of detail are exactly what lets us turn around a full resolution this quickly.

Developer Review — PR #81: Full resolution of onboarding & learning-path UX defects (#80)
Verdict: ✅ Approve — root causes were verified against source before any fix was written, every behavioral change is guarded by a test at the state layer, and the full gate (Inspector, CodeQL ×3, zizmor, Hadolint + image scans ×4, three test suites) is green with zero findings. This is how a defect ticket should be closed out.
What I verified
Completion model (OB-01/03/04) — The core fix is correct and minimal: DashboardTab now derives isSeriesComplete once and uses it to make active/completed disjoint by construction, rather than patching each symptom separately. Confirmed the three reported

Developer Review — PR #81: Full resolution of onboarding & learning-path UX defects (#80)
Verdict: ✅ Approve — root causes were verified against source before any fix was written, every behavioral change is guarded by a test at the state layer, and the full gate (Inspector, CodeQL ×3, zizmor, Hadolint + image scans ×4, three test suites) is green with zero findings. This is how a defect ticket should be closed out.
What I verified
Completion model (OB-01/03/04) — The core fix is correct and minimal: DashboardTab now derives isSeriesComplete once and uses it to make active/completed disjoint by construction, rather than patching each symptom separately. Confirmed the three reported symptoms (Resume on completed paths, wrong deep-link target, double-counted stats) all collapse into this one filter. The new test asserts the disjoint invariant directly (active ∩ completed = ∅ via Review-vs-Resume assertions), which matches the ticket's acceptance criteria.
Finish handler (OB-02) — handleFinish persists all outstanding steps then raises the existing (previously unreachable) congratulations screen. Wiring Finish away from handleBack and clearing deep-link hash params on exit kills the loop at both ends — the stale initialItemId re-open in AppDashboard was the subtle half of this bug and the fix (re-syncing deep-link params on every hash change, not just tab changes) also repairs the CommandPalette dropped-id redirect. Good catch.
Read-based milestones (OB-05) — Right call adding the durable KbArticleReads table instead of reading RecentViews (pruned at 50/user — completions would have regressed). Migration is additive-only; unique index on (UserId, ArticleId) ; tenant query filter matches the established pattern; feedback retained as a fallback signal so historical completions still count. Server test proves exactly-once marker creation through the real endpoint.
Scroll/theme/naming (OB-07/08 + follow-up) — Scroll reset covers step changes, tab changes, and the finish screen. Milestones/Steps split applied consistently, including the mislabeled "KB Articles Read" tile. Theme defaulting to light with an explicit Light↔Dark toggle is the correct resolution for a federated module inside a light host shell; legacy system → light migration is sensible.
R1 guided pathway — Guide-don't-gate implementation is appropriately light: catalog sortOrder as the prescribed order, banner + card tag + congrats-screen chaining, no route locking. No API changes needed.

fix: User On-boarding and Workflow Corrections + UI Polish #80
#83
Notes (non-blocking)
1. handleFinish awaits step-completion posts sequentially — fine at ≤5 steps/path; batch or Promise.allSettled if paths ever grow.
2. The KbArticleReads upsert is check-then-insert; a concurrent double-post could trip the unique index. Data integrity is protected, but consider catching the violation server-side eventually.
3. activeSeries retains its pre-existing .slice(0, 3) cap, so "Active Paths" tops out at 3. Acceptable now that completed paths are excluded; worth revisiting if catalogs grow.
4. Before merge-to-main / after dev verification: the four # TEMPORARY: pull_request deploy triggers from e2df5ae must be removed per repo convention — flagged as tracked follow-up.
5. Existing-user nuance is documented honestly: pre-fix article reads don't backfill; counters advance from next touch. Good transparency in the ticket response.
Test evidence
69 client (new: wizard finish/scroll/review/deep-link suites, dashboard disjoint counts, milestone checklist, guided pathway ×3) · 243 Admin API (new: read-completes-article, exactly-once marker) · 56 App API · tsc/ESLint/prod build clean · deployed and verified live in dev via temp PR triggers.

Summary
Full resolution of every defect and recommendation in issue #80 (DRAI Help Center onboarding/learning-path UX ticket). Root causes were verified against source before fixing; every fix is guarded by automated tests.
OB-01/03/04 — active/completed learning paths are now disjoint sets; completed paths show Completed + Review (never Resume); dashboard Resume targets the first incomplete step; stats no longer double-count.
OB-02 — Finish persists completion for all remaining steps and lands on the congratulations screen (previously wired to the back handler; the congrats screen existed but was unreachable).
OB-05 — onboarding articles now complete on read: new durable KbArticleReads table (+ EF migration AddKbArticleReads) written by the recent-views endpoint; feedback remains a fallback signal. Deterministic milestone ordering added.
OB-06 — dead prompt-card row replaced with an expandable, fully clickable checklist of all onboarding milestones.
OB-07 — scroll resets on step changes, tab changes, and deep links (app previously had zero scroll handling).
OB-08 — onboarding renamed to Milestones; Steps reserved for learning paths.
R1 — guided first-run pathway: Learning-tab banner (Start/Continue pathway), Recommended next card tag, and Start next path chaining from the congratulations screen. Guides without gating.
Deep-link hash writes use the canonical courses/paths format and clear on exit, killing the reopen loop and reload param loss.

NOTES

04 PARALLEL BUILD

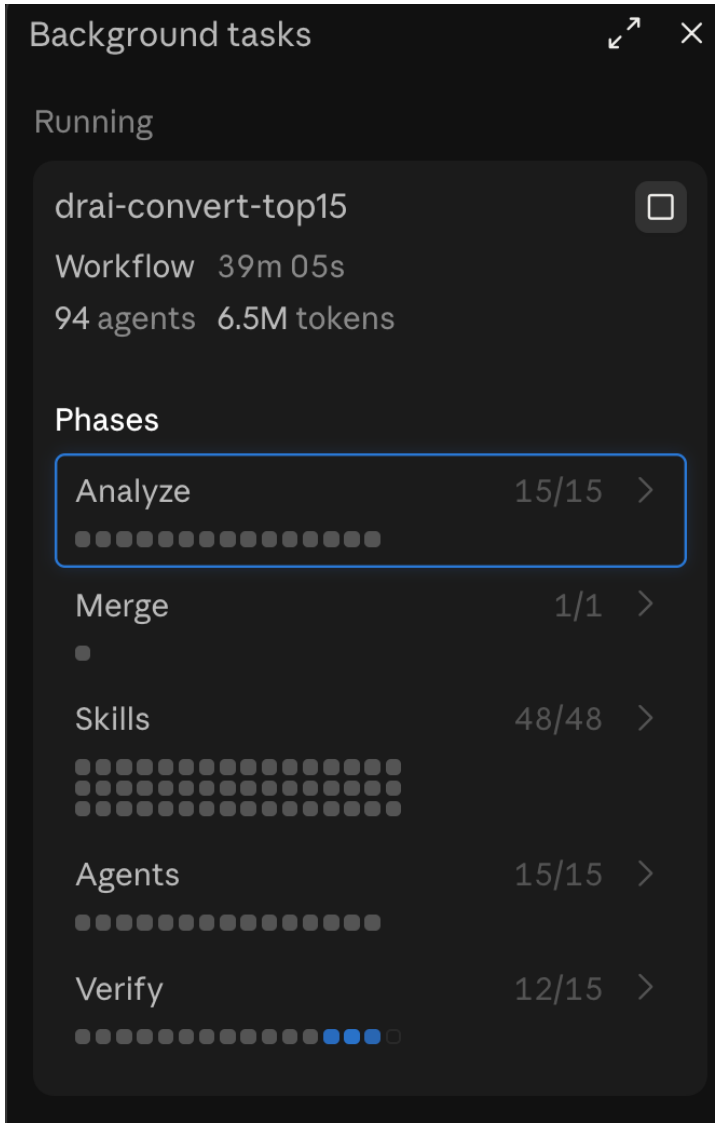

Parallel work without parallel chaos.

WHY PARALLEL IS FINALLY SAFE

- File-level and function-level dependencies mapped
- Shared schemas and API contracts known
- Component ownership and test coverage visible
- Integration risk assessed before work is assigned

HOW THE DAY RUNS

- Independent workstreams fan out to human-agent pairs
- Small, traceable commits against issue-scoped branches
- Colliding streams serialized by design, not discovered in merge
- Result: fewer collisions at higher speed
